compress

Next.js provides [gzip](#) compression to compress rendered content and static files. In general you will want to enable compression on a HTTP proxy like [nginx](#), to offload load from the `Node.js` process.

To disable **compression**, open `next.config.js` and disable the `compress` config:

`JS` next.config.js

```
1 module.exports = {  
2   compress: false,  
3 };
```
