<lmage>

▶ Examples

Note: If you are using a version of Next.js prior to 13, you'll want to use the next/legacy/image documentation since the component was renamed.

This API reference will help you understand how to use props and configuration options available for the Image Component. For features and usage, please see the Image Component page.

```
Js app/page.js
                                                                                               import Image from 'next/image';
 1
 2
    export default function Page() {
 3
 4
      return (
 5
        <Image
          src="/profile.png"
 6
 7
          width={500}
 8
          height={500}
 9
          alt="Picture of the author"
10
        />
11
      );
12
    }
```

Props

Here's a summary of the props available for the Image Component:

Prop	Example	Type	Required
src	<pre>src="/profile.png"</pre>	String	Yes

Prop	Example	Туре	Required
width	width={500}	Integer (px)	Yes
height	height={500}	Integer (px)	Yes
alt	alt="Picture of the author"	String	Yes
loader	<pre>loader={imageLoader}</pre>	Function	-
fill	<pre>fill={true}</pre>	Boolean	-
sizes	sizes="(max-width: 768px) 100vw"	String	-
quality	quality={80}	Integer (1-100)	-
priority	<pre>priority={true}</pre>	Boolean	-
placeholder	placeholder="blur"	String	-
style	<pre>style={{objectFit: "contain"}}</pre>	Object	-
onLoadingComplete	<pre>onLoadingComplete={img => done())}</pre>	Function	-
onLoad	<pre>onLoad={event => done())}</pre>	Function	-
onError	<pre>onError(event => fail()}</pre>	Function	-
loading	loading="lazy"	String	-
blurDataURL	blurDataURL="data:image/jpeg"	String	-

Required Props

The Image Component requires the following properties: src, width, height, and alt.

```
Js app/page.js
   import Image from 'next/image';
 2
 3 export default function Page() {
 4
   return (
 5
       <div>
 6
          <Image
 7
            src="/profile.png"
           width={500}
 8
 9
           height={500}
```

src

Must be one of the following:

- A statically imported image file
- A path string. This can be either an absolute external URL, or an internal path depending on the loader prop.

When using an external URL, you must add it to remotePatterns in next.config.js.

width

The width property represents the rendered width in pixels, so it will affect how large the image appears.

Required, except for statically imported images or images with the fill property.

height

The height property represents the *rendered* height in pixels, so it will affect how large the image appears.

Required, except for statically imported images or images with the fill property.

alt

The alt property is used to describe the image for screen readers and search engines. It is also the fallback text if images have been disabled or an error occurs while loading the image.

It should contain text that could replace the image without changing the meaning of the page ₹. It is not meant to supplement the image and should not repeat information that is already provided in the captions above or below the image.

If the image is purely decorative \neg or not intended for the user \neg , the alt property should be an empty string (alt="").

Learn more [¬]

Optional Props

The <Image /> component accepts a number of additional properties beyond those which are required. This section describes the most commonly-used properties of the Image component. Find details about more rarely-used properties in the Advanced Props section.

loader

A custom function used to resolve image URLs.

A [loader] is a function returning a URL string for the image, given the following parameters:

```
- src
```

- width

- quality

Here is an example of using a custom loader:

```
import Image from 'next/image';
 1
 2
    const imageLoader = ({ src, width, quality }) => {
    return `https://example.com/${src}?w=${width}&q=${quality || 75}`;
 4
 5
    };
 6
 7
    export default function Page() {
      return (
 8
 9
        <Image
10
          loader={imageLoader}
          src="me.png"
11
          alt="Picture of the author"
12
          width={500}
13
          height={500}
14
15
        />
16
      );
17
    }
```

Alternatively, you can use the loaderFile configuration in next.config.js to configure every instance of next/image in your application, without passing a prop.

fill

```
fill={true} // {true} | {false}
```

A boolean that causes the image to fill the parent element instead of setting width and height.

```
The parent element must assign position: "relative", position: "fixed", or position: "absolute" style.
```

By default, the img element will automatically be assigned the position: "absolute" style.

The default image fit behavior will stretch the image to fit the container. You may prefer to set object-fit: "contain" for an image which is letterboxed to fit the container and preserve aspect ratio.

Alternatively, object-fit: "cover" will cause the image to fill the entire container and be cropped to preserve aspect ratio. For this to look correct, the overflow: "hidden" style should be assigned to the parent element.

For more information, see also:

```
- position <sup>对</sup>
```

- object-fit 7
- object-position [↗]

sizes

A string that provides information about how wide the image will be at different breakpoints. The value of sizes will greatly affect performance for images using fill or which are styled to have a responsive size.

The sizes property serves two important purposes related to image performance:

- First, the value of sizes is used by the browser to determine which size of the image to download, from next/image 's automatically-generated source set. When the browser chooses, it does not yet know the size of the image on the page, so it selects an image that is the same size or larger than the viewport. The sizes property allows you to tell the browser that the image will actually be smaller than full screen. If you don't specify a sizes value in an image with the fill property, a default value of 100vw (full screen width) is used.
- Second, the sizes property configures how next/image automatically generates an image source set. If no sizes value is present, a small source set is generated, suitable for a fixed-size image. If sizes is defined, a large source set is generated, suitable for a responsive image. If the sizes property includes sizes such as 50vw, which represent a percentage of the viewport width, then the source set is trimmed to not include any values which are too small to ever be necessary.

For example, if you know your styling will cause an image to be full-width on mobile devices, in a 2-column layout on tablets, and a 3-column layout on desktop displays, you should include a sizes property such as the following:

```
import Image from 'next/image';
 1
 2
 3
    export default function Page() {
 4
     return (
        <div className="grid-element">
 5
          <Image
 6
 7
            fill
            src="/example.png"
 8
            sizes="(max-width: 768px) 100vw, (max-width: 1200px) 50vw, 33vw"
 9
          />
10
        </div>
11
12
      );
    }
13
```

This example sizes could have a dramatic effect on performance metrics. Without the 33vw sizes, the image selected from the server would be 3 times as wide as it needs to be. Because file size is proportional to the square of the width, without sizes the user would download an image that's 9 times larger than necessary.

Learn more about srcset and sizes:

- web.dev [¬]
- mdn [¬]

quality

```
quality={75} // {number 1-100}
```

The quality of the optimized image, an integer between 1 and 100, where 100 is the best quality and therefore largest file size. Defaults to 75.

priority

```
priority={false} // {false} | {true}
```

When true, the image will be considered high priority and preload 7. Lazy loading is automatically disabled for images using priority.

You should use the priority property on any image detected as the Largest Contentful Paint (LCP) ⁷ element. It may be appropriate to have multiple priority images, as different images may be the LCP element for different viewport sizes.

Should only be used when the image is visible above the fold. Defaults to false.

placeholder

```
placeholder = 'empty'; // {empty} | {blur}
```

A placeholder to use while the image is loading. Possible values are blur or empty. Defaults to empty.

When blur, the blurDataURL property will be used as the placeholder. If src is an object from a static import and the imported image is .jpg, .png, .webp, or .avif, then blurDataURL will be automatically populated.

For dynamic images, you must provide the **blurDataURL** property. Solutions such as **Plaiceholder** and help with **base64** generation.

When empty, there will be no placeholder while the image is loading, only empty space.

Try it out:

- Demo the (blur) placeholder[¬]
- Demo the shimmer effect with blurDataURL prop ¬
- Demo the color effect with blurDataURL prop ¬

Advanced Props

In some cases, you may need more advanced usage. The <Image /> component optionally accepts the following advanced properties.

style

Allows passing CSS styles to the underlying image element.

```
components/ProfileImage.js

const imageStyle = {
 borderRadius: '50%',
 border: '1px solid #fff',
 };

export default function ProfileImage() {
```

```
7  return <Image src="..." style={imageStyle} />;
8 }
```

Remember that the required width and height props can interact with your styling. If you use styling to modify an image's width, you should also style its height to auto to preserve its intrinsic aspect ratio, or your image will be distorted.

onLoadingComplete

```
<Image onLoadingComplete={(img) => console.log(img.naturalWidth)} />
```

A callback function that is invoked once the image is completely loaded and the placeholder has been removed.

The callback function will be called with one argument, a reference to the underlying element.

onLoad

```
<Image onLoad={(e) => console.log(e.target.naturalWidth)} />
```

A callback function that is invoked when the image is loaded.

Note that the load event might occur before the placeholder is removed and the image is fully decoded.

Instead, use onLoadingComplete.

onError

```
<Image onError={(e) => console.error(e.target.id)} />
```

A callback function that is invoked if the image fails to load.

loading

Recommendation: This property is only meant for advanced use cases. Switching an image to load with eager will normally **hurt performance**. We recommend using the **priority** property instead, which will eagerly preload the image.

```
loading = 'lazy'; // {lazy} | {eager}
```

The loading behavior of the image. Defaults to lazy.

When lazy, defer loading the image until it reaches a calculated distance from the viewport.

When eager, load the image immediately.

Learn more about the loading attribute ₹.

blurDataURL

A Data URL 7 to be used as a placeholder image before the src image successfully loads. Only takes effect when combined with placeholder="blur".

Must be a base64-encoded image. It will be enlarged and blurred, so a very small image (10px or less) is recommended. Including larger images as placeholders may harm your application performance.

Try it out:

- Demo the default blurDataURL prop ¬
- Demo the shimmer effect with blurDataURL prop ¬
- Demo the color effect with blurDataURL prop 7

You can also generate a solid color Data URL [¬] to match the image.

unoptimized

```
unoptimized = {false} // {false} | {true}
```

When true, the source image will be served as-is instead of changing quality, size, or format. Defaults to false.

```
import Image from 'next/image';

const UnoptimizedImage = (props) => {
  return <Image {...props} unoptimized />;
};
```

Since Next.js 12.3.0, this prop can be assigned to all images by updating next.config.js with the following configuration:

```
1 module.exports = {
2  images: {
3   unoptimized: true,
4  },
5 };
```

Other Props

Other properties on the <Image /> component will be passed to the underlying img element with the exception of the following:

```
- srcSet . Use Device Sizes instead.
```

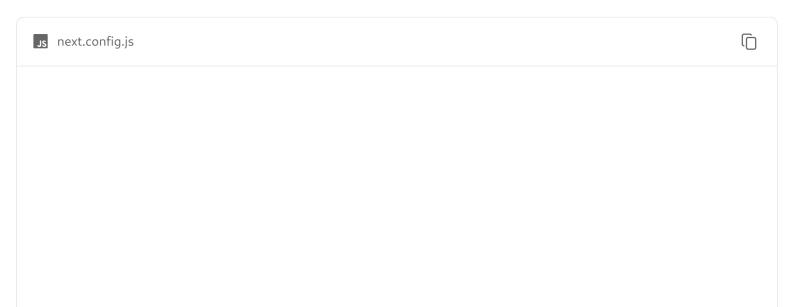

```
    decoding. It is always ("async").
```

Configuration Options

In addition to props, you can configure the Image Component in next.config.js. The following options are available:

remotePatterns

To protect your application from malicious users, configuration is required in order to use external images. This ensures that only external images from your account can be served from the Next.js Image Optimization API. These external images can be configured with the remotePatterns property in your next.config.js file, as shown below:

```
module.exports = {
 1
 2
      images: {
 3
        remotePatterns: [
 4
           {
 5
             protocol: 'https',
             hostname: 'example.com',
 6
 7
             port: '',
 8
             pathname: '/account123/**',
 9
          },
        ],
10
11
      },
12
    };
```

Note: The example above will ensure the src property of next/image must start with https://example.com/account123/. Any other protocol, hostname, port, or unmatched path will respond with 400 Bad Request.

Below is another example of the remotePatterns property in the next.config.js file:

```
Js next.config.js
    module.exports = {
 1
 2
      images: {
 3
        remotePatterns: [
 4
           {
 5
             protocol: 'https',
             hostname: '**.example.com',
 6
 7
           },
 8
        ],
 9
      },
10
   };
```

Note: The example above will ensure the src property of next/image must start with https://img1.example.com or https://me.avatar.example.com or any number of subdomains. Any other protocol or unmatched hostname will respond with 400 Bad Request.

Wildcard patterns can be used for both pathname and hostname and have the following syntax:

- * match a single path segment or subdomain
- ** match any number of path segments at the end or subdomains at the beginning

The ** syntax does not work in the middle of the pattern.

domains

Warning: We recommend configuring strict remotePatterns instead of domains in order to protect your application from malicious users. Only use domains if you own all the content served from the domain.

Similar to remotePatterns, the domains configuration can be used to provide a list of allowed hostnames for external images.

However, the domains configuration does not support wildcard pattern matching and it cannot restrict protocol, port, or pathname.

Below is an example of the domains property in the next.config.js file:

```
1 module.exports = {
2  images: {
3   domains: ['assets.acme.com'],
4  },
5 };
```

loaderFile

If you want to use a cloud provider to optimize images instead of using the Next.js built-in Image Optimization API, you can configure the loaderFile in your next.config.js like the following:

```
next.config.js

next.config.js

module.exports = {
   images: {
      loader: 'custom',
      loaderFile: './my/image/loader.js',
   },
},
}
```

This must point to a file relative to the root of your Next.js application. The file must export a default function that returns a string, for example:

```
1 export default function myImageLoader({ src, width, quality }) {
2  return `https://example.com/${src}?w=${width}&q=${quality || 75}`;
3 }
```

Alternatively, you can use the loader prop to configure each instance of next/image.

Examples:

- Custom Image Loader Configuration

Advanced

The following configuration is for advanced use cases and is usually not necessary. If you choose to configure the properties below, you will override any changes to the Next.js defaults in future updates.

deviceSizes

If you know the expected device widths of your users, you can specify a list of device width breakpoints using the deviceSizes property in next.config.js. These widths are used when the next/image component uses sizes prop to ensure the correct image is served for user's device.

If no configuration is provided, the default below is used.

```
1 module.exports = {
2  images: {
3   deviceSizes: [640, 750, 828, 1080, 1200, 1920, 2048, 3840],
4  },
5 };
```

imageSizes

You can specify a list of image widths using the <code>images.imageSizes</code> property in your <code>next.config.js</code> file. These widths are concatenated with the array of device sizes to form the full array of sizes used to generate image <code>srcset</code> s.

The reason there are two separate lists is that imageSizes is only used for images which provide a sizes prop, which indicates that the image is less than the full width of the screen. Therefore, the sizes in imageSizes should all be smaller than the smallest size in deviceSizes.

If no configuration is provided, the default below is used.

```
1 module.exports = {
2  images: {
3  imageSizes: [16, 32, 48, 64, 96, 128, 256, 384],
4  },
```

5 };

formats

The default Image Optimization API will automatically detect the browser's supported image formats via the request's Accept header.

If the Accept head matches more than one of the configured formats, the first match in the array is used. Therefore, the array order matters. If there is no match (or the source image is animated), the Image Optimization API will fallback to the original image's format.

If no configuration is provided, the default below is used.

```
1 module.exports = {
2  images: {
3  formats: ['image/webp'],
4  },
5 };
```

You can enable AVIF support with the following configuration.

```
next.config.js

next.config.js

module.exports = {
   images: {
     formats: ['image/avif', 'image/webp'],
     },
   }
};
```

Note: AVIF generally takes 20% longer to encode but it compresses 20% smaller compared to WebP. This means that the first time an image is requested, it will typically be slower and then subsequent requests that are cached will be faster.

Note: If you self-host with a Proxy/CDN in front of Next.js, you must configure the Proxy to forward the Accept header.

Caching Behavior

The following describes the caching algorithm for the default loader. For all other loaders, please refer to your cloud provider's documentation.

Images are optimized dynamically upon request and stored in the <distDir>/cache/images directory. The optimized image file will be served for subsequent requests until the expiration is reached. When a request is made that matches a cached but expired file, the expired image is served stale immediately. Then the image is optimized again in the background (also called revalidation) and saved to the cache with the new expiration date.

The cache status of an image can be determined by reading the value of the x-nextjs-cache response header. The possible values are the following:

- MISS the path is not in the cache (occurs at most once, on the first visit)
- (STALE) the path is in the cache but exceeded the revalidate time so it will be updated in the background
- (HIT) the path is in the cache and has not exceeded the revalidate time

The expiration (or rather Max Age) is defined by either the minimumCacheTTL configuration or the upstream image Cache-Control header, whichever is larger. Specifically, the max-age value of the Cache-Control header is used. If both s-maxage and max-age is preferred. The max-age is also passed-through to any downstream clients including CDNs and browsers.

- You can configure minimumCacheTTL to increase the cache duration when the upstream image does not include Cache-Control header or the value is very low.
- You can configure deviceSizes and imageSizes to reduce the total number of possible generated images.
- You can configure formats to disable multiple formats in favor of a single image format.

minimumCacheTTL

You can configure the Time to Live (TTL) in seconds for cached optimized images. In many cases, it's better to use a Static Image Import which will automatically hash the file contents and cache the image forever with a Cache-Control header of immutable.

```
1 module.exports = {
2  images: {
3    minimumCacheTTL: 60,
4  },
5 };
```

The expiration (or rather Max Age) of the optimized image is defined by either the minimumCacheTTL or the upstream image Cache-Control header, whichever is larger.

If you need to change the caching behavior per image, you can configure headers to set the Cache-Control header on the upstream image (e.g. /some-asset.jpg), not /_next/image itself).

There is no mechanism to invalidate the cache at this time, so its best to keep minimumCacheTTL low. Otherwise you may need to manually change the src prop or delete <distDir>/cache/images.

disableStaticImages

The default behavior allows you to import static files such as import icon from './icon.png and then pass that to the src property.

In some cases, you may wish to disable this feature if it conflicts with other plugins that expect the import to behave differently.

You can disable static image imports inside your next.config.js:

```
1 module.exports = {
2  images: {
3    disableStaticImages: true,
4  },
5 };
```

dangerouslyAllowSVG

The default loader does not optimize SVG images for a few reasons. First, SVG is a vector format meaning it can be resized losslessly. Second, SVG has many of the same features as HTML/CSS, which can lead to vulnerabilities without proper Content Security Policy (CSP) headers.

If you need to serve SVG images with the default Image Optimization API, you can set dangerouslyAllowSVG inside your next.config.js:

```
next.config.js

next.config.js

module.exports = {
   images: {
      dangerouslyAllowSVG: true,
      contentDispositionType: 'attachment',
      contentSecurityPolicy: "default-src 'self'; script-src 'none'; sandbox;",
   },
}
```

7 };

In addition, it is strongly recommended to also set contentDispositionType to force the browser to download the image, as well as contentSecurityPolicy to prevent scripts embedded in the image from executing.

Animated Images

The default loader will automatically bypass Image Optimization for animated images and serve the image as-is.

Auto-detection for animated files is best-effort and supports GIF, APNG, and WebP. If you want to explicitly bypass Image Optimization for a given animated image, use the unoptimized prop.

Known Browser Bugs

This next/image component uses browser native lazy loading 7, which may fallback to eager loading for older browsers before Safari 15.4. When using the blur-up placeholder, older browsers before Safari 12 will fallback to empty placeholder. When using styles with width/height of auto, it is possible to cause Layout Shift on older browsers before Safari 15 that don't preserve the aspect ratio 7. For more details, see this MDN video 7.

- Safari 15 and 16 [¬] display a gray border while loading. Safari 16.4 fixed this issue ¬. Possible solutions:
 - Use CSS @supports (font: -apple-system-body) and (-webkit-appearance: none) {
 img[loading="lazy"] { clip-path: inset(0.6px) } }
 - Use priority if the image is above the fold
- Firefox 67+ [¬] displays a white background while loading. Possible solutions:
 - Enable AVIF formats
 - Use placeholder="blur"

Version History

Version	Changes
v13.2.0	contentDispositionType configuration added.
v13.0.6	ref prop added.
v13.0.0	The next/image import was renamed to next/legacy/image. The next/future/image import was renamed to next/image. A codemod is available to safely and automatically rename your imports. wrapper removed. layout, objectFit, objectPosition, lazyBoundary, lazyRoot props removed. alt is required. onLoadingComplete receives reference to img element. Built-in loader config removed.
v12.3.0	remotePatterns and unoptimized configuration is stable.
v12.2.0	Experimental remotePatterns and experimental unoptimized configuration added. layout="raw" removed.
v12.1.1	style prop added. Experimental support for (layout="raw") added.
v12.1.0	dangerouslyAllowSVG and contentSecurityPolicy configuration added.
v12.0.9	lazyRoot prop added.
v12.0.0	formats configuration added. AVIF support added. Wrapper <div> changed to .</div>
v11.1.0	onLoadingComplete and lazyBoundary props added.
v11.0.0	src prop support for static import. placeholder prop added. blurDataURL prop added.
v10.0.5	loader prop added.
v10.0.1	layout prop added.
v10.0.0	next/image introduced.
