# onDemandEntries

Next.js exposes some options that give you some control over how the server will dispose or keep in memory built pages in development.

To change the defaults, open `next.config.js` and add the `onDemandEntries` config:

next.config.js

```js
1  module.exports = {
2    onDemandEntries: {
3      // period (in ms) where the server will keep pages in the buffer
4      maxInactiveAge: 25 * 1000,
5      // number of pages that should be kept simultaneously without being disposed
6      pagesBufferLength: 2,
7    },
8  };
```
